Your guide to women’s health and wellness

As bodies change through the years, so do health needs and goals. To help support women throughout each age and stage of life, Leonardo DRS provides a range of benefits through your Leonardo DRS medical plan – including preventive care, family planning resources, menopause support and more. Many of these benefits are available to you and your eligible family members at no additional cost.

This guide provides information about women’s health* to help support your overall well-being. Ready to explore all that’s available?

*“Women’s health” is a broader term used to describe conditions, services or supportive programs and resources, not to describe those supported. UnitedHealthcare provides supportive resources for all eligible individuals, regardless of gender identity.

Preventive care for women

Keeping up with preventive care is a good way to help manage and maintain your health throughout your life.

An annual wellness visit is included in your health plan*

Preventive care is designed to help detect potential health issues early on, when they’re typically more treatable. Early detection is key, and it often starts with an annual wellness visit with your primary care provider (PCP).

Your PCP is the health care provider who knows you best and understands your health history and health goals. They’re who you turn to first for preventive care, routine screenings, immunizations and more. During this visit, your PCP generally focuses on evaluating your health when you’re symptom-free. Depending on your age and other factors, your PCP may recommend certain preventive screenings. Your medical plan covers eligible preventive care, services and screenings.

Recommended preventive screenings for women¹

Age	18	25	30	35	40	45	50	55	60	65	70	75+
Annual wellness visit	Every year											
Blood pressure screening	Every year											
Breast cancer screening (mammogram)					Every 1-2 years starting at 40, or as recommended by your PCP							
Cervical cancer screening, including Pap smear		Every 3 years starting at 21 until 65, or as recommended by your PCP										
Cholesterol screening					Every year							
Colorectal screening						Every 10 years starting at 45, or as recommended by your PCP						
Diabetes screening					Every year							

* Your annual wellness visit is covered, but added services, diagnostic care and tests may result in deductible or coinsurance costs.

Need a network PCP?

Expanding your family

The path to parenthood can look different for everyone. No matter how you’re looking to grow your family, support is available.

Preparing for a healthy pregnancy

Fertility and preconception health

If you’re thinking about becoming pregnant, it’s a good idea to meet with your health care provider – usually your PCP or gynecologist – to get a checkup and review your health history. There are also things you can do on your own to prepare for pregnancy, like maintaining a healthy weight and eating a nutritious diet. If you have fertility concerns, your provider can help you explore your options and navigate next steps.

Prenatal care

The earlier you start your prenatal care – the care you receive while pregnant – the better. Prenatal care is one of the best ways to help reduce the risk of complications for both you and your little one.²

Prenatal appointments may include:

- An estimated due date
- A review of your medical history
- A physical exam
- Blood tests
- Measuring your baby’s growth
- Checking your baby’s heartbeat
- Checking your blood pressure
- Recording your weight
- A urine sample or urinalysis
- At least 1 ultrasound, possibly more

Additional tests may be required, depending on your needs. Your provider will decide how often they want to see you throughout your pregnancy.

Prenatal appointments may be scheduled:

- Once a month from weeks 4–28
- Every 2 weeks from weeks 28–36
- Every week from weeks 36–40

If you’re 35 or older or have a pre-existing health condition, your provider may want to see you more frequently.

High-risk pregnancy care

A high-risk pregnancy is when the mother and/or baby are in danger of having complications – and it often requires special care to help everyone stay as healthy as possible. Meeting with your provider is the best way to determine if you have or could have a high-risk pregnancy.

Factors include:

- **Existing health conditions** – Including diabetes, high blood pressure or being HIV positive
- **A mother’s age** – Teens and those who are 35 and older have a higher chance of blood pressure problems
- **Multiple births at once** – May increase the chance of early labor and birth, and may cause high blood pressure and other complications with delivery
- **Being overweight or obese** – Has been linked to stillbirth, infant heart defects, high blood pressure and Caesarean (C-section) delivery, among other issues
- **A history of pregnancy problems** – Such as early delivery

Some factors that cause a pregnancy to be high-risk can’t be avoided. Some of these start in pregnancy, like gestational diabetes. Other factors can be treated before a pregnancy to reduce the risk for complications.

Signs and symptoms include:

- Vaginal bleeding
- Stomach or chest pain
- A fever over 100.4°F
- Dizziness
- Fainting
- A fast or fluttering heartbeat
- Queasiness and vomiting that is more than just morning sickness
- Thoughts of self-harm or hurting your baby
- Trouble breathing
- The slowing or stopping of your baby’s movement
- Severe headache or blurry vision

Having a high-risk pregnancy makes it especially important to keep up on prenatal appointments. Each high-risk pregnancy is treated in its own way depending on the mother’s health condition. This may include medications for certain conditions or help making healthy life changes.

If you experience any of these symptoms, contact your provider right away.

Important note

After welcoming your baby, you’ll need to add them to your health plan within 31 days of their birth (even if you already have family coverage) to ensure coverage under the Leonardo DRS medical plan. More information is available in the **2026 Benefits Guide**, which can also be found on the Benefits page of the DRS Intranet.*

*Available on the DRS network.

Maternity support benefits

Here are the maternity support programs and services that are available to you:

- **Fertility Solutions**

Fertility Solutions provides helpful information, emotional support and experienced guidance as you explore options for expanding your family. Work with a fertility nurse who can help guide you to treatment options and care facilities, which may include getting care from a Fertility Center of Excellence.
- **Neonatal Resource Services**

If your baby needs extra care after they’re born, Neonatal Resource Services gives you 1-on-1 access to an experienced neonatal nurse who can answer your questions, help make sure they get the best possible care and get you ready for life at home with your baby.
- **Maven Maternity & Newborn Care**

Maven’s Maternity & Newborn Care program supports members through pregnancy, postpartum and the newborn stage, with added support for pregnancy loss and return to work. Members have 24/7 access to virtual care across 35+ specialties, plus a dedicated Care Advocate for personalized support.

Click here to join today at mavenclinic.com/join/ldrs or download the Maven Clinic app.

Menopause and healthy aging

Around age 45, women’s estrogen and progesterone levels start to naturally dip and then plateau. This is usually the beginning of menopause – or the stage in life when women stop having periods – and it’s a normal part of aging.

Stages of menopause

Technically, menopause starts when your body goes a full 12 months without a period. Your menstrual cycle may have been on autopilot since puberty, with your ovaries producing plenty of estrogen to keep your monthly flow regular. As you move into your late 40s and early 50s, the ovaries make less and less estrogen until there’s no longer enough for your body to release an egg. This is what triggers natural menopause.

Natural menopause is a gradual process that happens in 3 stages:

- 1

Perimenopause
 - The time leading up to your last period, which may last 8-10 years (the average is 4 years)
 - Estrogen and progesterone levels slowly start to drop
- 2

Menopause
 - Reached once you’ve gone a full year without any menstrual bleeding
 - Ovaries stop producing enough estrogen to release eggs
- 3

Postmenopause
 - Comes after a full year of menopause
 - You’re period-free for the rest of your life

5 menopause myths⁴

- Myth 1: Menopause begins at 50**

Fact: Menopause may start anywhere between the late 30s to early 60s. The average age is 52.
- Myth 2: Weight gain is inevitable**

Fact: While lower estrogen levels during menopause may slow metabolism, an exercise routine and nutritious diet may help maintain overall health.
- Myth 3: Menopause causes weak bones**

Fact: Losing bone mass is a normal part of the bone breakdown and buildup process. Most women have enough bone mass to handle the loss after reaching peak bone mass at 30.
- Myth 4: Hot flashes are the first sign**

Fact: While hot flashes are a sign of menopause, there’s a wide variety of symptoms – and each can range in severity and frequency.
- Myth 5: Menopause only causes physical symptoms**

Fact: Shifting hormones during menopause may influence emotions and cause changes in memory and concentration.

What to expect before and during menopause

Each woman has a different experience with perimenopause and menopause symptoms, so you could have just a few or many. If you notice some of the following symptoms, you may be transitioning into – or in the thick of – menopause:

- Hot flashes
- Night sweats or cold flashes
- Vaginal dryness or discomfort during sex
- Urgent and/or more frequent need to urinate
- Difficulty sleeping
- Mood swings or mild depression
- Dry skin, eyes or mouth
- Tender breasts
- Irregular periods
- Worsening premenstrual syndrome (PMS)

These changes are caused from your body having less estrogen and from the ups and downs of other hormone levels. It’s basically your body trying to balance itself back out. You might also notice things like:

- Racing heart
- Headaches
- Joint and muscle aches
- Change in libido
- Difficulty concentrating or remembering
- Weight gain
- Hair loss or thinning

Talk with your provider about ways you can help manage symptoms. Some can be addressed through lifestyle changes, while others through natural remedies (like herbals and supplements) or medicine.

Tips for postmenopausal health

- Keep your body strong by getting exercise, eating a nutritious diet and avoiding alcohol and tobacco
- Talk to your provider about bone health and ways you may be able to help prevent and manage osteoporosis
- Reduce stress with yoga, meditation, massage therapy, acupuncture and other activities that help you feel a sense of calm
